TITLE : METHOD AND DEVICE FOR
CERTIFICATE ISSUANCE FOR GAME

ABSTRACT : PURPOSE: To effectively evaluate a level of game skillfulness by storing threshold value clear data representing a score which is calculated while a game is in progress and exceeds a threshold value in a game program storage medium when the score exceeds the threshold value and printing a certificate including an image on a printer.

CONSTITUTION: When a floppy disk FD is loaded on a drive 15, a game program, a point threshold value and other data are read by a whole control circuit 10, and stored once in a memory 17. Image data stored once is read out under the control of an image display control circuit 12, and converted to an analog video signal by a digital/analog conversion circuit 13, and after that, it is supplied to and displayed visually on a display device 22. When the point scored in a game by a player exceeds the point of the point threshold value decided in advance, the whole control circuit 10 stores a threshold value clear flag in the software recording area for game of the floppy disk FD. In this way, the image data representing the image to be printed is supplied to the printer.
